How to Measure Your Driveline

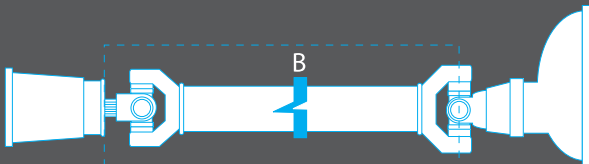

To obtain accurate measurements for new driveline lengths, follow these guidelines:

The vehicle should be at its running height and resting on all four wheels. Insert the correct slip yoke into the rear of the transmission until it bottoms, then back it out 3/4 of an inch.

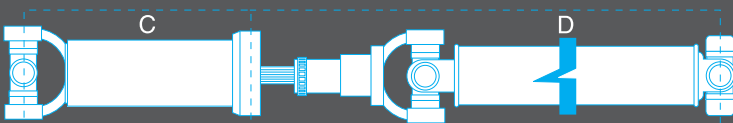

In this position the shaft length can be determined by measuring from the centerline of the front u-joint, to the centerline of the rear u-joint (dimension A). The slip yoke should be supplied to Coast Driveline to ensure proper balancing. (We stock slip yokes for most applications)

If no slip yoke is used measure from the seal face of transmission to the centerline of the rear yoke (dimension B).

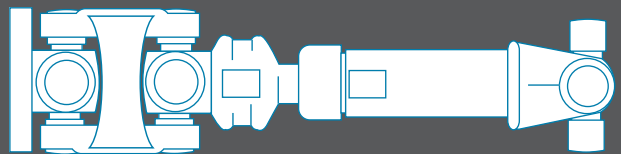

In the case of 2 piece drivelines, measure from the centerline of the front yoke to the centerline of the carrier bearing (dimension C), and from the centerline of the carrier bearing to the centerline of the rear yoke (dimension D).

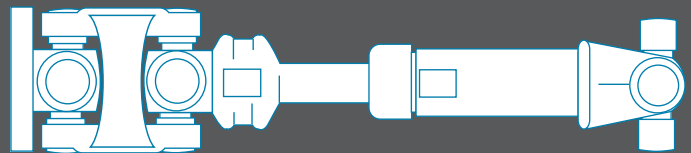

These basic rules will assist in 95% of all applications. Call our driveline shop at (800) 533-8087 with any questions.

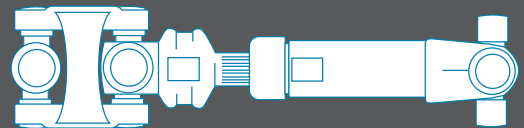

We use quality Dana Spicer U-Joints and components. We can even build oversized shafts that can handle extreme torque produced by large displacement engines and
